OBSERVATIONS:

Group 6)

- **Badly written commits.**

The commits are misspelled since the commits must report the change they have made to the program so that the other contributors know of the change they made and in the commits of the group they appear with the same name which does not say anything, also the commits must be loaded from the console and the confirmations of this group are loaded from the page itself.

- **Class diagram inspection.**

Methods and relationships in the diagram do not match the methods in the code. In the "04UMLDiagrams" folder there are no separate folders for the two diagrams. In the documents in the folder "04UMLDiagrams" are repeated.

```

public class Diagnostic {

    private String cie10;
    private String name;

    public Diagnostic() {
    }

    @Override
    public String toString() {
        return "Diagnostic{" + "cie10=" + getCie10() + ", name=" + getName() + '}';
    }

    public void resgister() {
        Scanner scan = new Scanner(System.in);
        System.out.println("=====");
        System.out.println("*****Cie-10 data*****");

        System.out.println("Name of diagnosis");
        setName(scan.nextLine());

        System.out.println("CIE-10: ");
        setCie10(scan.nextLine());
    }
}

```

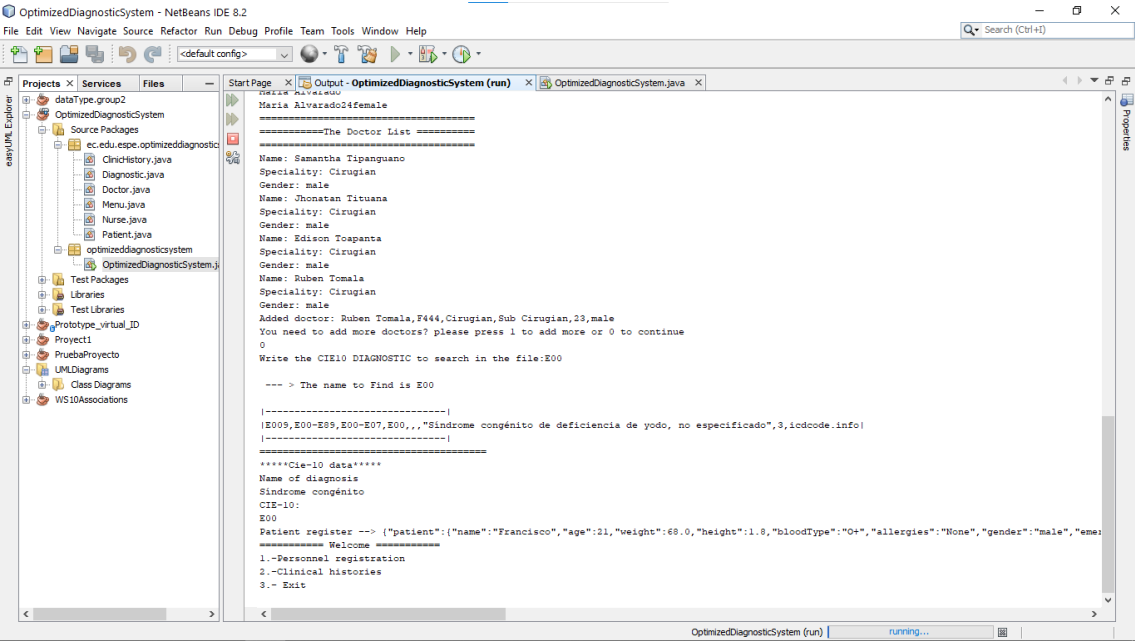

- There is no error message when another user enters.

In the medical history menu, the user who registered in the registration menu must be entered, but if any other user is entered, it continues to run without showing any error message, an error is only displayed when the password is entered incorrectly. it should display an error message that is understandable to the customer. .

- The project prints the data on the screen in json format, but does not store it in a file.

This program was printed on the screen in json format but after checking the files it did not save as gson format.

- The validations at the time of saving the data are not validated.

At the time of saving the data of the doctor and the medical history, it gives us a confirmation message (True to save; False to not save), but after typing any of the two options, the program also saves the data.
